He has worked up his reputation through film, TV and comics, not to mention a series of successful novels featuring a variety of heroes and heroines. He has been involved with comic books since the 1970s and is most well known as the writer/creator of the current Wonder Woman title. His recent work includes King City, featuring the Justice League of America, and Justice League of America: The Doom Patrol, as well as Doom Patrol itself. In addition, he also has a long history with DC's S.W.A.T. Comics, writing titles such as Metal Men and Legionnaires. He has also been working on an animated series about the Doom Patrol for Cartoon Network, which will premiere later this year. Still, he is best known as the penciller of the critically acclaimed, award-winning Wonder Woman. After a battle with the Amazonian sorceress, she had become aware of the existence of her own kind, the Amazons, and of a life that has been hidden from her from birth. Supergirl, the new title, is due to hit bookshelves August 2009. That said, I am not quite as familiar with the writer's background as I would like to be. So, let's hear from you, my favorite interviewers, as to what you think of his work 91bb86ccfa

Initiating and maintaining antiretroviral therapy is crucial to reduce HIV morbidity and mortality and prevent the emergence of multi-drug resistant viral strains. In spite of the availability of effective antiretroviral therapy, there are still 4.8 million people living with HIV/AIDS in sub-Saharan Africa. In addition, at least 47,000 people in the United States die every year of HIV infection. The major impediments to successful antiretroviral therapy in developing countries are limited access to skilled health care workers, a lack of laboratory infrastructure and supplies, and poor patient compliance and adherence. An effective antiretroviral drug delivery system (DDS) that can improve access to treatment in resource-limited settings would not only make antiretroviral therapy more widely available to the HIV-infected population, but may also mitigate risks associated with developing drug resistance. Nanotechnology is a promising DDS option for treating HIV/AIDS in developing countries because of its potential for improved targeting of drugs to critical tissues, enhanced bioavailability and biodistribution of drugs, and reduced side effects and toxicity. Nanoparticle-based systems can provide a solution to overcoming the complexity of drug delivery challenges currently faced by developing countries and provide new opportunities for improving the efficacy and specificity of HIV DDS. In this grant, we propose the development of multifunctional HIV-targeted nanoparticles to improve antiretroviral therapy. The ability of nanoparticles to be tailored for delivering drugs to different cell types and tissues makes it possible to target HIV primarily in critical tissues and cells, while sparing non-target tissues. We have preliminary data showing that HIV-targeted nanoparticles for treating HIV infection can successfully deliver viral entry inhibitors and immune modulators. We hypothesize that this promising HIV-targeted nanoparticle platform can be developed to deliver antiret
