Adding artistic touches The expression "editing" doesn't mean that you have to keep your photo at its original size and resolution. Of course, that's the typical way to work, but if you want a more creative and artistic result, you can scale the image. For example, you can always make a large 2-inch × 3-inch (5cm × 7.5cm) print of your 22" × 30" (55cm × 76cm) original. And whether you print on an inkjet, laser, or dye-sublimated photo printer, you can enhance the colors and tones you want to maintain. Photoshop includes creative tools that enable you to quickly and easily edit your photos to fit your artistic vision and your printing needs. Many of these tools provide great enhancements to your photos. You can further retouch and enhance your photos to produce some of the most stunning photographs around.

## What's New in the?

Free energy simulations using all-atom protein models: towards the complete room temperature unfolding of the proteinase 3 from tick-borne encephalitis virus. The 55-kDa tick-borne encephalitis virus (TBEV) proteinase 3 (P3) is a type II serine proteinase belonging to the chymotrypsin family. P3 is well characterized for its proteolytic activity on its natural substrates, i.e. the polyprotein containing the P3 region. Studies on the protein kinetics and thermodynamics are limited. In this work, the 1° structure of P3, the resolution of the crystal structures of its full length and the ribosome-inactivating (Type I-s) and xylanase (Type III-b) substrate-binding domains, and the dynamic behavior of the two-domain TBEV proteinase 3 model were determined by molecular dynamics simulations at 300 K. The two domains of P3 are correlated by a high flexibility hinge. The folding of the two domains of P3 appears to be continuous during the simulated time range, without interconversion of state. The TBEV proteinase 3 model is highly stable in the thermodynamic sense, and its conformational stability can be inferred by its observation of high dynamics, RMSD fluctuations and temperature. All these results, regarding the stability and dynamics, are in agreement with the oligomeric states observed experimentally. Free energy simulations allowed us to detect seven essential regions (ERs) for the dynamic behavior of the TBEV proteinase 3. The ER was verified for the natural substrates of P3 and their binding sites with the enzyme. The four regions III-B and III-A, III-B-1 and III-B-2 detected with the TBEV proteinase 3 model

correspond to the ones reported for the xylanase substrate-binding domain. The X-ray structure of the Type III-b TBEV proteinase P3 region does not contain important regions for dimerization. The results obtained indicate that the dynamic behavior of the proteinase 3 model is determined by the nature of interactions with the substrates; the Type III-b domain regulates the stability and the dynamics of the proteinase 3 monomer. The dynamic behavior of the Type I-s TBEV proteinase 3 is the result of the protein association for each substrate, and the presence of a high flexibility hinge. The results obtained herein give hints on the role of the
