Full body motion and smooth animations, and a cartoonish style of animation and designs make me feel as if I were watching a Japanese anime, which can be the Gameplay: 8/10 The first half of the story is very well developed, with several unique twists and a good resolution to it all. I highly recommend it for people who are having trouble finding their way through Amour Mode for the first time. I would have even given it a higher score if I was able to save a legitimate copy for when I get bored...6.5/10 Therese Newton, Gamemaster If I Hated It: This game isn't bad per se, its just not very good either. They made a mistake by continuing this after the first game. Like I said earlier. I'd love to see some more games that go into a relationship, similar to "Girl Friend Beta" but a more mature game. After the first game, are pretty short, and I didn't really enjoy the gameplay. 5.2/10 Therese Newton, Gamemaster I think you're a much better writer than you are a game designer. If anyone on here actually likes the story I would recommend you find a new job, because you probably wouldn't be good at it.5/10 Ryan Farrant, Tech-Gaming Longer than most games: NEKOPARA is truly an amazing title in terms of length. Instead of being rushed through the ending, you can enjoy the characters and their individual stories. I would be much more enjoyable. 6.5/10 Therese Newton, Gamemaster If I Hated It: I really liked how this game was longer than most. I was torn on how to evaluate this, because some aspects of the game were really good and others really bad. I went into this with a fairly open mind and didn't really regret playing it.5/10 Therese Newton, Gamemaster I didn't like it because it didn't give a long enough story. This game wasn't good enough for me to buy it and install it

What's new:

Greenhouse Gas Levels Challenge Climate Change Denial By François Bouchot Mankind's health and the future of the planet are dependent on climate change adaptation. Now, a new scientific study indicates that levels of greenhouse gases in the atmosphere are dangerously high and continuing to rise. Up to 1000 billion tons of carbon is being released each year: more than is absorbed in the land, forests and oceans combined. In other words, emissions are rising faster than carbon sinks can be able to reduce them. An international research team led by Carnegie Mellon University scientist Mario Molina used to cover a vast international area of land, rich in forests and peatlands. They were known for their pioneering work in the 1990s in restoring degraded soils. They are also experts in using satellite imagery to track land changes and peatland degradation. Their new research indicates that carbon emissions worldwide are increasing faster than previously thought and that the effective "carbon sink" in the land sinks have been able to counterbalance these emissions only once in every five years. Indeed, the current rate of carbon emissions from the land is 11 times the rate as it was in 1997. Carbon dioxide, methane, and nitrous oxide emissions (CO, CH, and NO) have increased dramatically in the past 50 years. But until about 20 years ago, concentrations of all three gases were decreasing. This led many scientists to believe that the "tipping point" of a coming climate change had already passed. In 2000, when Canada ratified the Kyoto Treaty, the mayor of Ottawa declared in a speech: "Let us declare a victory over the problem of climate change." Shortly thereafter, the European Union declared on their part that, "Our climate is changing." However, this assumption that the climate is turning around was to be an illusion. In 2005, a new study showed that CO2 levels had risen 17% since the same year in 1997, largely because of oil use. The press generally downplayed the results, as most media outlets were supported by large industrialized industries. However, the recent scientific study, released by the Global Carbon Project in October 2006, shows alarming levels of greenhouse gases. According to their data, between 2004 and 2005 emissions of greenhouse gases were higher than in 1997. This previous, 1997-level followed significant releases in the 1980s and 1990s. The previous dropped to 1990 levels only in 2008. Despite the reality of high levels
