That sounds good, but I am wondering, what is the difference between the two versions? A: If you look at the update history you can see that the 2.22 version is the first build that was released for the 2.26 version, and there were quite a few fixes and improvements in the 2.22 version that weren't in the 2.26 version. So, the 2.22 version will be more stable and has less bugs than the 2.26 version. For more information on what the differences are and what's coming in future versions, you might want to check the project's github page. The last version that was released was, 2.26.0.20, and there's no further updates to this version. You can check it here. Best regards. The present invention relates to the art of controlling for controlling the speed of a vehicle by controlling the flow rate of air into and out of the vehicle. In present-day passenger-type vehicles the brakes are controlled by means of a fluid pressure supply and exhaust system so that brake fluid pressure is built up in front wheels and reduced in rear wheels when the brake pedal is depressed. Also, a conventional vehicle provided with such a brake system is generally provided with a brake cooling device which forces air through a turbine-type fan in order to blow air over the brake disc in the front wheels thereby to prevent brake disc from overheating. However, in present-day automobiles, when an abnormality occurs in the power system or a breaker of electric appliances provided in the vehicle is open due to impact, a large current is caused to flow through the power system and a large electric power is generated in some situations, for example, when there is great fluctuation of current. In such a case it is impossible to cool the brakes by discharging brake fluid under pressure to the atmosphere from the brake system. Accordingly, in such a case, it is necessary to expel air from the inside of the vehicle. If a vehicle is driven by an electrically operated motor for a prolonged period, a large quantity of air is expelled from the inside of the vehicle when the vehicle is stopped, and the vehicle is left in a high temperature state. If the degree of heat build-up in the vehicle is great, the efficiency of the engine of the vehicle tends to be lowered, which makes it difficult to start the vehicle.Q: How to add/rename/move images in the website?
