I was wondering if there is a formal mathematical model for modelling "simultaneous nature" of a set of random variables? In other words, what would be the probability of a formula-tree of a tree model generating the natural tree (see the example) such that the given variables are variables of the one of the nodes of the tree? I am familiar with the existence of some statistical models (e.g. for hanafian trees) which can generate a tree. But these are not models for "simultaneous nature" as above. A: You can use probabilistic logic. If you have n random variables $X_1,\ldots,X_n$, each of them m-ary, then you can encode the independence of them by an $n\times n$ matrix T where each entry is a conditional probability, e.g. $T_{x_1x_2}=\Pr(X_1=x_2\mid X_1=x_1)$. The principal entries of T are just the marginals, i.e. $\Pr(X_i=x_j)$. Then T has the property d41b202975

I told you I wasn't here to get into all that is good about this game. Have a quick look at my phalanx of bullet points to see why this is my favourite game of the moment, though! Short takes? The attention to detail in this is mesmerising. It has been 5 years since we first saw the Scarecrow Games' JW Leigh's brand of stop-motion, long before anyone thought to call it this. For veterans of the medium,

the look has been often imitated but never bettered, so it was one of the standout games of the 12 - from a barebones platformer to a visually ground breaking experience that was so stunning, we begged to throw at it. What is Little Nightmares? It's an intense death match between two much talked about protagonists, in two different genres. One is a cute, chubby little bear called Screech (who may or may not be too happy with you quite yet!) and the other is a big, ethereal mind-bending nightmare with a haunting vision. The idea is to navigate between the two environments to escape and unlock memories from the Nước Hải, the Sea of Joy.
