This URL path has an Android exception that stops the app from loading. When I run the application, I get this error: troubleshooter://Message?action=clearUnread&process_path=/app/build/tmp/manifest/qr_view_TvLFZxT1ZM8.tmp.getDirectories() Your device is not supported for this app. If your device is not Android, see the FAQs. Or visit for more information. This message occurs on app startup. It clears out the notification bar on Android (as expected) and opens my own application's URL on my Android phone. That is, as soon as the app is launched, the URL path I am referencing is opened in the phone's browser. I can see the following in the console: Set of devices attached to Studio. Press Ctrl+C to stop. Then, a few seconds later, I get the crash above. This occurs on all my devices. I need to stop the app from launching the url, so I added an onShowWindow() event. I did it just like the documentation says to. I'm using the following code: alert('shown')} /> When I run this code, I get an alert box saying "shown", but no new window opens on my Android device. What am I doing wrong?
