Composed of the overlapping segments of a human heart, a body has both an internal strong and weak side. When the internal aspects of a human are competing or interacting with each other, it is said that they are in a disequilibrium. The heart is intricately connected with other internal organs via blood vessels; a person can even hear their heartbeat through blood flowing in the vertebrae through the sacrum. Change in heart rate is an indicator of various diseases. If the heart rate increases, there is abnormality in the function of heart muscle. A racing heart in a young person could be a warning sign of a dangerously rising blood pressure; however, a down or slowed-down heart could also indicate a problem.

Fluid accumulation in the lungs is likely to cause shortness of breath, coughing, and chest pain with breathing. A severe accumulation of fluid in the lungs can collapse the lungs and result in death within hours or days. Do not take any action until a professional physician has made a diagnosis of the problem.

Measurement of the blood pressure from lower arm is a significant aid for a physicians in the diagnosis of heart disease. To do such measurement, force the patient to remain motionless for 15-20 minutes.
