Es tambien posible obtener la soluciÃ³n a la pregunta actual de este sitio: Q: use SELECT to display only 2 columns (ID - Name) only from table in database I have a table in database with below structure ID | NAME to display the result in table, I used "; echo ""; while (\$line = mysql_fetch_array(\$query, MYSQL_ASSOC)) { echo " ".\$line['name'].""; echo " ".\$line['id'].""; } echo ""; echo ""; ?> I am getting error message: Notice: Undefined offset: 1 in..... However, the expected result is show only the first two field to be displayed in table like this ID | Name ID7 | J.H. How do I fix this? Thanks for your answers A: while (\$line = mysql_fetch_array(\$query, MYSQL_ASSOC)) { should be while (\$line = mysql_fetch_array(\$query, MYSQL_ASSOC)) { other than that, you should wrap your table-related code in the while loop. Without it, mysql_fetch_array gives you undefined offset warnings about columns no longer in the array, even though your code is inside the while loop. Try: while (\$line =

```
mysql_fetch_array($query, MYSQL_ASSOC)) {  
    echo "";
```

MEMRIS - MEMRIS.1. Field of the Invention The present invention relates generally to rotational instruments used for medical procedures such as arthroscopic operations, and more particularly to such devices used to guide a saw blade or other cutting implement. 2. Description of the Prior Art Rotational instruments are used in various medical procedures during which it is necessary to cut or remove a portion of a patient's body. An example of such a procedure is an arthroscopic operation wherein the interior of a patient's knee joint is accessed through small incisions made in the knee joint, and arthroscopic instruments are inserted into the joint to view the interior, clean and/or irrigate the joint, and remove, i.e. resect or cut, tissue through the instrument. An arthroscope is a surgical instrument used in

arthroscopic operations and typically includes a light source, an endoscope which is a visualizing optical instrument with a camera disposed at its distal end, an eyepiece and a fiber optic light transmission system which delivers light from the light source to the endoscope. The arthroscope is inserted into the patient's body through the incision and positioned in the joint by an arthroscopist. The arthroscopist views the joint through the arthroscope and uses the arthroscope to examine the joint and its contents including tissue, and to clean and/or irrigate the joint through the instrument, as
