A: The error is happening because both the large and small files are getting concatenated. If they don't have identical size, one file will be re-created as the other. If the files are already present on your computer, try creating the folder separately with both files in it, and try moving the files. With age, the fine structure of the hair, such as the diameter and the diameter distribution of the hair, tends to become abnormal. Such a change in fine structure results in unsatisfactory hair conditions such as unsatisfactory aesthetics and unsatisfactory feel. Consequently, a variety of methods of maintaining and improving the conditions of the hair have been suggested. As for the techniques for maintaining and improving the conditions of hair, there are known a method in which hair is cut into portions in which the cuticle has not been damaged, and is subjected to a heat treatment such as a heating at a temperature not lower than the pain threshold (JP-B-4-38765, JP-B-4-38765 and JP-A-2-47579); and a method in which hair is bleached and then is cut into the portions in which the cuticle has not been damaged, followed by a treatment of the hair portions at a temperature not lower than the pain threshold (JP-A-10-278522). In the above-described techniques, the conditions of hair are improved. However, these conventional techniques are not intended to improve the conditions of the hair while the hair is converted from the less damaged to the no damaged condition. It is well-known that the circumference of hair is large and also that the outermost layer of hair is closely adhered to the scalp of the wearer. The conventional techniques hardly improve the conditions of hair at that portion. It is well-known that the diameter and the diameter distribution of hair vary with the color of hair. For example, it has been reported that the diameter of the hair is largest in black hair and is smallest in red hair. Such a difference in diameter of hair with the hair color has been found not only in the hair length, but also in the hair thickness. It is generally known that the hair thickness is reduced by aging. With the conventional techniques, however, the diameter of hair is not adjusted while the hair is converted from the damaged to the non-damaged condition. Consequently, the diameter of hair is changed in a manner independent of the color of hair. In view of the above- e79caf774b

Students are acquiring information on the internet and social media rather than learning from textbooks. However, the information which is accessible over internet could be erroneous or incomplete and act as a source of misinformation. The internet and social media are responsible for creating new information and publishing of them without due caution or quality assessment. ^[@B1]^ This could lead to misinformation which could later on be misleading. This misinformation could either be true or false, and might have serious complications. Hereby, the authors present a case report of an asymptomatic patient, who, during their routine work-up for the cause of increasing abdominal pain, was found to have a high suspicion of two differential diagnoses, which later turned out to be correct. CASE REPORT ===== A 44-year-old female, who was otherwise healthy, presented to the emergency department with acute onset of abdominal pain of 2 days duration with a history of constipation. The patient was diagnosed with constipation and received emgent iv (IV) hydration. However, her pain persisted and she complained of recurrent episodes of vomiting. The patient was then scheduled to get done with the investigation in two to three weeks, but the pain persisted for more than a week and still she had no relief. She again visited a private clinic, which took three days and all investigations were normal, except for a mild increase in the serum iron level. The patient was referred back to our clinic for a regular follow up. During the scheduled follow up, she complained of abdominal pain and discomfort and was found to be febrile. Her blood investigation showed no significant changes in hemoglobin, liver function tests, renal function test, serum electrolyte tests and coagulation profile. Ultrasonography of the abdomen showed multiple thickened loops of the small intestine which were suggestive of intestinal obstruction. A plain abdominal radiograph ([Fig. 1][#F1]{ref-type="fig"}) was suggestive of bowel obstruction. The patient was admitted and reviewed with the surgical
