Q: 1D shader - trace an object over a path and on to next I am working on a sketch, and I want to get a smooth path from an object (for example a car). So I want to trace a circle and get a smooth curve and apply it to a model like so: But for the model, I want to do it on the next frame. What is the best way to do that with directx9? I am a newbie, so if you can just give me a link with tutorial I'll do that. A: You need a vertex shader to do this, and maybe also some sample code for drawing a circle. If you want to use standard shaders, use the vertex shader first, which is more flexible and has access to the object's model matrix. Then you need to sample the radius from the object and pass it to the fragment shader via a varying parameter. in the fragment shader, you need to apply a sine function on the radius to get a smooth curve and then interpolate with the original radius to get a smooth transition: float sine(float x, float y) { return sin(x * y); } float3 coeff = 1.0 - abs(sine(radius, interval)); float3 color = coeff; interval is a parameter you set per-vertex.
