Q: How to pass a command line parameter to the parent process (C#) This question seems like it should

---

have been asked a thousand times but I could not find a "relatively" simple example. In my application, I have a program running which takes a set of parameters (2 strings) from the command line. This program is child process of a main application process. Is

---

there a way that I can pass those  
2 strings into my main  
application process in a way that  
the main application can easily  
use it? I don't want to create too  
many places for storing those  
arguments in my main app and  
doing something like `MyProgram.Main(args.ToArray());` seems

---

like a pretty big hassle. A: Use  
named arguments. I.e.  
`process.StartInfo.Arguments =  
"path1 path2";` A: This should  
work for you. `Process proc = Pr  
ocess.Start(@"c:\Program.exe",  
"argument1", "argument2");` A:  
There are a number of ways to  
do this: Pass them as command-

---

line arguments. Then you can get them using `Environment.GetCommandLineArgs()` (assuming of course, you are in console app) Pass them as a property of the `Process.StartInfo` and read them from the

are leaking? I've been using  
nitrile gloves for some time at

work without any issue.  
However, this morning, one of the pair started to leak around the finger hole around the finger bar, and I don't know what caused it to do so. It looks like it's started from the skin side, but I don't see any discoloration. Is there a way to check and see

---

what went wrong without opening the glove or damaging it? A: Have you tried carefully observing the glove after the latex barrier on the back of the glove has been peeled away? If you notice anything unusual in the fabric (color, discoloration, etc) you could try a few more

---

gloves in different brands and sizes to see if the problem is consistent. Also, using a seam ripper could be helpful to check the seams. Q: SSL certificates - how to verify Here is my very basic test: Here is my verify:
