The action center is where you'll find the tools and commands used to modify an image. You can view the action center options by selecting Edit > Edit with Photoshop Elements > Action Center. The Tools panel includes tools that you use to modify an image. The Swatches panel houses the color themes you choose to use for the various editing tools. The Layers panel displays the active image layer and any additional layers. The Levels panel displays the color balance of an image's image. To adjust an image, you first select an image element and use the editing tools to modify its properties. You also can make changes to the image by using keyboard shortcuts. The available editing features vary according to the tool you use. For example, you can use the Pen tool to draw lines, curves, text, and circles, whereas the Magnetic Lasso tool allows you to select objects and move them. Other tools use different techniques, such as the Distribute tool, which automatically splits a layer into multiple layers. You can apply adjustments to an image using the Adjustment Layer feature. You make a copy of the original image, which you can manipulate in any way you like without affecting the original. Because you can use the Adjustment feature with multiple layers, you can blend many different effects and adjustments all into one layer without creating an extra layer for each adjustment. Photoshop's tools enable you to manipulate color, contrast, exposure, brightness, and contrast, to name a few. It's important to know what each tool is capable of doing as you work with it. For example, the Exposure tool doesn't affect color tones. It only affects brightness, so in order to make adjustments to skin tones, you use a different tool such as the Levels tool. Photoshop includes a Grid feature, which enables you to align objects on a grid, making it easier to align them. The Object Snap feature enables you to automatically align an object or group of objects to the edge of a specified object. The Smart Guides feature enables you to automatically adjust the canvas size to fit the object without losing the alignment or sharpness of the pixels. In some images, you may see a layer move without automatically adjusting the canvas size. If that happens, click the Lock Transforms button in the Layers panel to lock it in place. In the following sections, we explain each tool in detail. The Pen tool The Pen tool is a vector-based tool that enables you

To edit an image, you need to insert text, place items, crop and resize, add colours and even create a vector outline using path tools. The software supports most types of image file including JPEG, TIFF, PNG, GIF, BMP, and many others. Most file types can be opened in the software with only minor modifications to the file format (for example, the JPEG support a smaller maximum file size). The software also supports GIF animation, which can be used to create self-contained animations and even create interactive websites. Photoshop Elements can be used to create: Editing images Cropping, resizing, modifying images Adding text Adding lines and shapes Adding or cutting-out shapes Adding or making selections Adding a complete wallpaper to an image Making your own templates for use in webpages, email, social media and more Making a collage with multiple images and a selection border Making an animation from an existing image Finding and replacing different parts of images Resizing pictures for print Creating a vector shape and saving it as a new layer Writing text with the layers and raster tools Creating a web or mobile template for use in layouts, websites, etc Using the tools You need to choose an image file and insert it into the software. You can insert a JPEG, TIFF, PNG, GIF or BMP image file. Photoshop Elements can open and save many image file formats. First, you need to load the image. Loading an image is as easy as selecting the image and clicking the "load" icon in the upper toolbar. You can also drag and drop an image into the editor. The interface is easy to understand. The software contains tabs in the window that represent the various editing tools. There are several tabs at the top with buttons for different functions: The Painting Tools This is the most basic tool in the program. It contains basic layers, tools for painting and erasing layers, layer masks, and colour samplers for selections. The tools are similar to those of the regular Photoshop editing tool (as shown in the manual) The Paths and Vector tools These tools are for creating new shape layers. You can create new paths by drawing with the pen tool. The software supports both straight and curved path tools, two freehand tools, and a vector er 05a79cecff

1. Field of the Invention The invention relates to building assemblies and more particularly to roofing construction assemblies.

2. Description of the Prior Art Shingled roofs of the single and double layer variety and poured-in-place insulations have become common as the practice of building and specifically commercial and industrial building construction has developed and evolved. These roofs require a specialized set of skills for their installation and are time consuming to install. In addition, once installed, they require ongoing maintenance, which is time consuming. Over the years, various techniques for the installation of roofs have evolved. Roofs are generally supported by the use of roof trusses made of elongated beams, which are connected together by a variety of different roof support members and bracing members. In addition, clips and other types of clip members are used to secure roof support members together and to secure the roof support members to elongated beams of the trusses. One problem with the various prior art constructions is that they are often expensive and thus do not meet the initial cost requirements for many commercial buildings. Another problem is that they are heavy, making it difficult and time consuming to install them on a building. Yet another problem is that the clips or other fasteners that are used to secure members of the roof together are more susceptible to being damaged during installation and during the installation of subsequent elements. Still another problem is that the roof assemblies need to be custom fit to the trusses in order to allow for expansion and contraction between the roof and the trusses. Yet another problem is that they can be time consuming to install. Yet another problem with many prior art systems is that they are not sufficiently mobile and have to be carefully installed over a truss beam member. Yet another problem is that the roof assemblies require extensive skill to install and do not accommodate a variety of types of roof support beams. Thus, there is a need for a roofing support system that resolves these problems. It is a main object of the invention to provide a roofing support system that is easy to install and does not require extensive skill to install. It is another object of the invention to provide a roofing support system that accommodates a variety of roof support members. It is a further object of the invention to provide a roofing support system that is light in weight and inexpensive. It is a further object of the invention to provide a roofing support system that is mobile and can be installed over a truss beam member and jacked to a desired height

What's New In?

Electric utility companies generally have their own balance sheet, but it is commonly accepted that a prudent investor should treat the balance sheet of an electric utility as a separate entity. In reviewing the financial reports of an electric utility, it is also desirable to present these balance sheet reports in a fashion that is intelligible to a common investor. This is particularly true when comparing the financial performance of different electric utility companies, including comparing the financial performance of the same electric utility over different time periods. It would be a significant contribution to the art if a method were provided to measure and report the financial performance of an electric utility without the need of complicated non-financial information. The present invention provides financial performance measurement and reporting methods that readily facilitate comparison between electric utility companies, between electric utility companies and their segments, and between different periods of an electric utility company. The present invention is a computer program that when executed by a computing device produces a financial performance measurement and reporting method that allows users to compare the financial performance of a specific electric utility company with itself over multiple time periods. A computer user interface is used to obtain the financial performance measurement and reporting method. The financial performance measurement and reporting method includes receiving specific electric utility financial information, calculating financial performance measurements, presenting the financial performance measurements in a selected format, and selecting a computer program output format. The financial performance measurements are typically financial measures of the company's activities and include gross cash flow, net profit, return on investment, return on equity, and return on asset. These are then presented in a selected format. This format may include producing a chart, a table, a bar graph, or the like. The computer program output format may include producing a user-defined report, a web report, or the like. The financial performance measurement and reporting method includes receiving specific electric utility financial information. This specific information is selected from a number of financial statements that might be reported by the company. The financial information selected is in the form of data fields that define the financial information. The financial performance measurement and reporting method includes calculating financial performance measurements from the specific electric utility financial information. This comprises determining a measure of the company's performance for a specific time period and using that performance measure to compare the company to itself over multiple time periods. Finally, the financial performance measurement and reporting method includes

producing a financial performance measurement and reporting output using the financial performance measurements. Specific electric utility financial information includes financial statements which may be in any one of a variety of formats. Exemplary financial statements include the
